

DATA 130 - GitHub Activity

Add Your First Project to Your Data Science Portfolio

Goal

Add a small Python project to the Projects section of your Data Science Portfolio. You will practice creating folders and files, writing a README, making meaningful commits, and viewing how your work changes over time.

Starting Point

You should already have this structure in your GitHub repository:

```
data-science-portfolio
|-- data-science-profession
|   -- README.md
|-- projects
|   -- README.md
-- README.md
```

Part 1 - Create Your First Project Folder and Python File

1. Open your data-science-portfolio repository.
2. Click Add file -> Create new file.
3. In the filename box, type: projects/greeting-project/hello.py
4. Paste the Python code below into the editor.
5. Click Commit changes and use the commit message: Create greeting project.

My first Python project in GitHub

```
def greet_user():
    name = input("Enter your name: ")
    print(f'Hello, {name}! Welcome to Data Science.')

if __name__ == "__main__":
    greet_user()
```

Part 2 - Think About the Code

What do you think `input()` does?

What do you think `print()` does?

In your own words, what does this program do?

Part 3 - Add a README to Your Project

Create a second file named: `projects/greeting-project/README.md`

Use the following as a starting point:

```
# Interactive Greeting Project
```

```
## About This Project
```

```
This is my first project stored in my Data Science GitHub portfolio.
```

```
## What It Does
```

```
This Python program asks the user for their name and displays a personalized greeting.
```

```
## Tools Used
```

```
- Python  
- GitHub  
- Markdown
```

```
## What I Learned
```

```
[Complete this section after finishing the activity.]
```

Commit message: Add project README

IN-CLASS CHECKPOINT

Before leaving class, you should have a `greeting-project` folder containing `hello.py` and `README.md`. If you do not finish, continue with the steps below at home.

Part 4 - Personalize Your Code (Finish at Home)

Edit `hello.py` and change the program in at least TWO meaningful ways. Make the program your own. Do not simply change spacing or punctuation.

After making your changes, commit them separately with a descriptive message that explains what you changed.

My commit message:

Part 5 - Look at What Changed

Open your commit history and compare your original program with your revised program.

What changed between your original and revised program?

How does GitHub show you those changes?

Part 6 - Finish Your Project README

Return to `projects/greeting-project/README.md` and complete the What I Learned section. Then add:

```
## Future Improvements
```

If I continued working on this project, I would...

Commit message: Update project documentation

Part 7 - Add Your Project to the Projects Page

Open `projects/README.md` and add your first project to the page:

```
## My Projects
```

```
### Interactive Greeting Project
```

My first Python project created in GitHub.

[View Project](greeting-project)

Commit your changes with a meaningful message.

Final Reflection

1. What was the most useful thing you learned about GitHub?

2. What was the most confusing?

3. What kind of Data Science project would you eventually like to add to your portfolio?

AI Use Statement (Required)

At the end of your submission, write a brief statement describing whether and how you used a generative AI tool while completing this activity. If you used AI, identify the tool and explain what you used it for. If you did not use AI, state that no generative AI tools were used.

AI Use Statement:

Grading - 10 Points

Component	Points
Correct project structure	2
hello.py created and personalized	2
Project README and portfolio link	2
Multiple meaningful commits	2
Reflection + AI Use Statement	2
